Crowning of logs in Bolsters

07/05/15

Team we need to put some effort into the crowning of our loads.

We need to ensure the logs are locked in and the tie down strap is securing each and every log. The last thing we want is to lose a log on the public Road and injurer someone or something.

Good example of a well crowned load

By rolling this one log into the middle would result in a better looking load.

I know this is not always easy to achieve with different log sizes and grades creating their own set of challenges. I am sure if loader operators / truck driver put their minds to it and keep an eye on this issue it will be eliminated.
